Port53

Port53 Technologies is focused on delivering enterprise-grade, cloud-delivered security solutions that are easy to deploy, simple to manage and extremely effective, helping customers not only get a big-data and predictive approach to security, but also a more integrated and automated approach. Port53 Technologies is currently working closely with Cisco's leading security offerings in Cisco Umbrella, AMP for Endpoints, Meraki, Cloud Email Security, Duo Security and CloudLock, as well as other cloud-delivered security solutions such as OneLogin and Lacework. To enable SMBs to safely and securely

Mission Statement

Thrive in the digital world by delivering enterprise-grade solutions that are easy to deploy, simple to manage, and extremely effective.

Our Why

In today's world, it is not the change in technology that is important to note, but rather, the rate of change in technology. Companies big and small that are in the forefront of these rapid changes and advancements are the ones that will be best positioned to succeed. For organizations around the world, the most critical areas of today's technological growth are in Information Security, Cloud Adoption, IoT, and Big-Data Solutions.

However, with new technologies being released seemingly every day, and with the amount of noise that is driven by broad-based marketing tactics, it is hard for IT Professionals to stay on top of what technology is best for their organizations. Port53 Technologies was formed to assist SMB organizations in quickly and confidently testing, deploying and implementing the right technology solutions that best fit their needs and environment.

Our How

Cloud computing allows for unlimited compute, unlimited storage, and unlimited analytical power, which creates an incredible platform to deliver big-data driven, advanced and proactive security protection at a pay-per-use model. With the power and elasticity of the cloud, we are able to deliver the same enterprise-grade security and protection that Fortune 500 companies deploy to small and mid-sized businesses. Protection that was not accessible to SMBs a few years ago, but is now necessary.

What to Look For in a Cybersecurity Solution

When buying cybersecurity protection, small businesses face many choices. What kinds of solutions are really needed? How do you pick the right option? Should you pick a cloud-based solution or something on-premise? Pick the wrong solution and you may be under-protected, spending way too much money, or hopelessly bogged down with too many alerts or debugging systems that just aren't working well together.

The myriad of cybersecurity solutions can be very confusing for SMBs. There are many dozens of security solutions out there, each protecting a different aspect of your system. In the Cisco 2019 CISO Benchmark study, 14% of organizations reported having more than 20 vendors, and 3% had more than 50.

As you acquire multiple vendor solutions, each will have a unique dashboard or alert. Trying to orchestrate the alerts from a multi-vendor system can tax even the largest organizations.   You need to find a way to limit the numbers of vendors and have the remaining solutions integrate so you can better manage the alert information and identify which threats need attention. Cisco is a leader in providing integrated solutions that automate the initial stages of alert prioritization, helping you focus on those alerts that are most important.
